Legend:

- net model PnL
- ETF leg MTM
- underlying leg MTM
- borrow cost drag
- T-cost drag
- model rebalance
- actual ETF trade
- actual underlying trade (shared)

The chart displays several metrics over time from February to July 2026. The y-axis represents dollar amounts, ranging from 0 to 15,000. The x-axis shows months from Feb to Jul 2026. Vertical lines indicate model rebalances (dashed blue) and actual ETF trades (solid red). The legend identifies the following series:

- NBIS short gross (solid green line)
- NBIS short gross (solid purple line)
- total gross (dashed teal line)
- beta-adjusted ETF gross (dotted blue line)
- model rebalance (dashed blue vertical line)
- actual ETF trade (solid red vertical line)
- actual underlying trade (shared) (dotted purple vertical line)

The chart shows significant volatility in the gross values, particularly in the total gross and beta-adjusted ETF gross series. The actual ETF trade and actual underlying trade events are marked by vertical lines, often coinciding with model rebalances. The NBIS short gross series shows a general upward trend, peaking around 10,000 in late June before declining.

The chart displays the price of the iShares MSCI Emerging Markets ETF (EEM) from February to July 2026. The y-axis represents the price, ranging from 100 to 250. The x-axis shows the months from February to July 2026. The legend identifies four data series: NBIS adj close (solid black line), model rebalance (dashed blue line), actual ETF trade (solid red line), and actual underlying trade (shared) (dotted purple line). The price starts around 100 in February, rises to a peak of approximately 280 in late June, and then declines to around 200 by July. Vertical lines indicate rebalancing events, with two red lines marking actual ETF trades and several blue lines marking model rebalances.
